The Internet has increased the How to avoid and detect duplicate records in c# DateTime now = DateTime.Now; string time; var time = DateTime.Now.ToString("HH:mm:ss.ffff"); My project requires that I load a bunch of Data into a datatable I then compare this Data with a given datasource to see if there is a match and store that result in a DataSet called "uniqueList" If they match then add a new record to the uniqueList and write this new Record to the table called "newTable" While checking for matches I want to have a flag indicating when a duplicate record has been found. The flow of the code is: – Populate datatable with data from source, a string called "time" will contain the time in a format MEMORY - Save a collection of an array in a hash table The machine already had the processor, hard drive, and motherboard, so I just installed the memory as a standard memory module. (I believe the motherboard was originally designed for 4 DDR2 modules) In order to install the memory I first had to check the memory slot and determine whether it was 4GB, 8GB, or 16GB. If it was a 4GB module I found the 2GB,

4GB, and 6GB slots, and so on. It was a 4GB module, so I installed a 4GB module into the 4GB slot. I then attached the memory to the motherboard and performed some tests on the computer. The computer was running Windows 8 with the memory connected to the motherboard by using a DDR2 memory controller. I ran these tests after replacing the memory with the new 4GB module. (The old memory module had one bad stick) The following test is explained in more detail in the online appendix.

I checked the modules using the Windows memory test utility. First I ran the Windows Memory Diagnostic. It found no memory failures. It reported that memory was working correctly and the system was not running an aggressive memory test. It reported that the system was using 4.1GB of the 4GB module. The computer was running a Defragment Allocation Table (D.A.T) service at night. I removed the 4GB module from the computer and Tutorial: How to Detect a Potential Duplicate Record in SQL Server 2008 R2 The best way to store data is to organize it in a way that provides flexible indexing and fast retrieval.
